## Magazine of natural mistory.

[SEVENTH SERIES.]

No. 106. OCTOBER 1906.
XXXVI.—Natural Histor! Notes from R.I.M.S. 'Imesti-gator.'-Series III., No. 10. On Mollusca from the Bay of Bengal and the Arabian Sea. By Engar A. Smiti, I.S.O.
[Concluded from p. 175.]

## Bathybembix Nevilli, sp. n.

Testa turbinata, imperforata, alba, pcriostraco tenui griseo induta : spira conica, pagodiformis ; aufractus 8-9, supra concave declives, infra medium angulati, ad angulum acute tuberculati, supra ad suturam tuberculati, infra ad suturam minute denticulati, lineis incrementi obliquis striati, ultimus infra angulum tulereulatum liris quiaque crenulatis cinctus ; apertura obliqua, irregulariter rotundata, intus sulcis leribus $4-5$ sculpta; labrum tenue, basi subexpansum; columella alba, incrassata, reflexa, callo tenui labro juncta.
Alt. 30 mm ., diam. maj. 26, min. 22 ; apertura 12 longa, 13 lata.
Hab. Station 277, south of Ceylon, 859-880 fath.
The minute tuberculation or crenulation at the suture and the creuulation of the fire basal lire are caused by the lines of grouth. The acute tubereles are about twenty in number upon the last whorl, and tecome smaller and closer together as they ascend the spire.

Rather like B. argenteo-nitens, Lischke, from Japan, but smaller, with a thicker external calcareous suriace, more Ann. d Mag. N, Ilist. Ser. 7. Vol. x viii. 18
acute tubercles, and stronger lines of growth making the basal lire more distinctly crenulated.

Named 13. Nerilli in remembrance of my late friend Geoffrey Nerill, formerly of the Indian Muscum, Calcutta.

## Gaza (Callogaza ?) Frederici, sp. n.

Testa breviter conica, late umbilicata, albo-margaritacea ; anfractus 8, regulariter lente acerescentes, plani, supra et, infra serie tuberculorum achtorum ornati, lineisque incremeuti obliquis sculpti, sutura canaliculata sejuncti, ultimusad peripheriam carina secunda pulcherrime serrata cinctus, infrá liris coneentricis quinis minute scrratis ornatus: apertura oblique subquadrata, intus iridescens, margaritacea: labrum leviter incrassatum, album, subexpansum; columella reflexa, umbilicum partim obtegens, callo tenui labro juucta.
Diam. maj. 25 mm ., min. 23 ; alt. 20 .
HIcb. Station 333, Gulf of Manar, 401 fath.
A single specimen ouly. It is a very beautiful form and well characterized by its macreous surface, the rows of acnte tubereles at the upper and lower part of the whorls, the deep channelled suture, the wide pervious umbilicus, partly corered by the reflection of the colmmella, and the bicarinate character of the body-whorl The lower keel, which forms the periphery, is very finely serrated by the clearty developed lines of growth. Of the five basal lire, which are also minutely serrated, that which borders the umbilicus is stouter than the rest.

Basilissa putula, Martens, is more widely umbilieated, has a third row of acute nodules, only four on the basc, and a less raised spire, and the characters of the peristome appear to be different if Martens's shell was mature.

Named after my friend Mr. F. Bearis, who was much impressed with the beanty of this shell.

## Calliostoma admirandum, sp. ч.

Testa clate acute conica, imperforata, pallide cornea, maculis sat uratiuribus irregulariter picta; anfractus 9 , plani, sericbus quinque granulorum minimorum, serichns minoribus intercalantibus, ornati, ultimus ad peripheriam acute angulatus, infra concentrice liratus, liris circiter l2, subgranulatis, rufo punctatis ; apertura obligua, subquadrata; colunella albar, incrassata, obliqua, leviter archata, reflexa.
1ham. 17 mm , alt. 20.
Hab. Station 258, W. of 'l'awancore, 10:? lath., sand.

The series of gramules on the last and pemultimate whorls are alternately larger and smaller, but on the upper volutions the finer gramules are wating.

## Glyplis delicutu (Smith).

Fïsure ella tlelicata, Sumith, Am. \& Mar. Nat. Hist. 1890, vol. ir.

Hul. Station 3:33, Gulf of Manar, 401 fath.
A single specimen, diflering from the type only in its greater size. It is 39 mm . long, 2t broad, and 14 high.

Puncturella (Citanopsis) asturiana (Fischer).
Puneturella (C'rmmpsis) asturiana, Smith, Ann. \&E Mag. Nat. Hist. 1896, vol. xviii. p. 371 ; 1904, vol. xiv. p. 5.
Ilab. Station 333, Gulf of Manar, 101 fath.
This is another instance of the same species occuring in the Indian and Atlantic Oceans. The only slight difference hetween the shells from the above locality and those obtained by the 'Challenger' Expedition in the West Indies in 390 fath. is that the slit is perhaps a little nearer the apex in the Manar shells than in those from Culebra Island.

Scaphander mundus, Watson, var.
Scaphhander mundus, Watson, Gasteropoda 'Challenger' Expel. p. 643, pl. xlviii. fig. .2.
Huh. Station 276, W. of Ceylon, 1003 fath.; off Arrou l., 80') fath ('Challenger').
'The 'Investigator' specimens are rather more finely punctate than the types, but are similar in other respects.

Scaphander andamanicus, Smith.
Scaphander andamarricus, Smith, Am. is Mag. Nat. Hist. 1894, vil. xiv. p. 16̄7, pl. iv. tig. 15; 1904, vol. xir. p. $\overline{\text { b. }}$
Hab. Station 256, W. of Ceylon, 937 fath., green mud; Station 273, off Malabar coast, $8: 23-870$ fath. ; Station 3: 1, S. of Ceylon, 660 fath.

## Scuphander cancellatus, Martens.

Scuphander cancellutus, Martens, Deutsch. Tiefsee-Exped. 'Valdivin,' vol. vii. p. 131, pl. v. fig. 19.
Hab. Station 32:2, Andaman 1slands, 378 fatlı.; Station 259, W. of Malabar coast, 295-360 fath., green mad and sand ; W. of Sumatra, 4r0-616 metres (Murtens):

Althongh varying somewhat in form, some examples being narrower than others, the strong cancellated sculpture will distinguish this species from its congeners.

## Scaphander vicimus, sp. n.

Testa orata, mediocriter tennis, alba, periostraco tenni pallido lntescenti induta, hæris, nitida, interdum lineis elatis transversis vel carinis instructa, lineis incrementi striata, et spiraliter transrersim leviter punctata, punctis elongatis gracilibus; apertura alba, supra aufractum producta; columella valde arcuata, incrassata, reflexa, callo tenui apici juncta.
Longit. 36 mm ., diam. 24.
Hab. Station 318, W. of Ceylon, 1085 fath.
More delicately punctate than S. mundus, Watson, S. andumanicus, Smith, or S. cancellatus, Martens. S. alatus, Dall, is closely allied, but has the lip peculiarly produced, and S. nobilis, Verrill, has a different columella and sculpture.

## Dentalinm magnificum, Smith.

Ientalium magmificum, Smith, Ann. \& Mag. Nat. Hist. 1896, rol. x riii. p. 371 ; 1904, vol. xiv. p. 7 ; Illust. Zool. 'Investigator,' Mollusca, pl. rii. figs. 5, $5 a$; Pilsbry, Man. Conch. vol. xvii. pp. 78, 251.
Hab. Station 232, off Travancore coast, 430 fath., grey mud; Station 265, off N. of Ceylon, 225-594 fath., mud; Station 323, N. of Andaman Islands, 463 fath.; Station 327 , W. of Burmah, 419 fath.

The specimens from Station 232 are a trifle more slender than the typical form, but in other respects quite similar. A young specimen from Station 327, 73 mm . in levgth and 8 at its broadest end, tapers to a finc point only 1 mm . in diameter, and there exhibits a very narrow slit 5 mm . in length.

## Dentalium keras, Watson.

Dentalium keras, Watson, 'Challenger' Scaphopoda, p. 3. pl. i. fig. 4 ; Dall, Bull. Nus. Comp. Zool. Harrard, vol. xriii. p. $42 \overline{2}$; Pilsbry, Man. Conclı. vol. xvii. p. 68, pl. iii. fig. 41.
Hab. Station 316, S. of Ceylon, 1500 fath.
These specimens are much finer than the 'Challenger' type from the mid-Pacific, E. of Japan. The largest is $6 ? \mathrm{~mm}$. in length and 11 in diameter at the aperture.

## Dentalium mrofundorum, Smith.

Dentalium mofundormu, Smith, Amm. © Mag. Nat. IIist. 18:3t, rol. xiv. 1. 16í, pl. iv. fig. 18; Dilsbry, Man. Conch. vol. xvii. p. 79, pl. vi. tir. $8:$.
Hab. Station 283, off E. of Ceylon, 1086 fath.; Station 331, off' Audaman Islande, 569 fath.

The single very slender specimen from Station 3331 , although 80 mm . in length, is only 6 mm . at the broadest diameter. This results from its jerfect growth from the very young state, the young shell not being broken as is generally the case in these large Dentalia. It tapers to a point less than a millimetre broad, and exhibits in the usual position a very fine slit 4 mm . in length. The examples from Station 283 are quite like the original type from of Colombo.

## Deutatium servulatum, sp. n.

Testa solidiuscula, leriter arcuata, lente attenuata, longitudinaliter tenuiter lirata, liris srpe plus miuns minute serratis, transrersim tenuiter striata, striisque longitudinalibus indistincte decussata, alba, postice breviter fissurata; apertura circularis.
Longit. 56 mm ., diam. max. 6.
Hab. Andaman Islands, 60 fath.
The distinguishing feature of this species is the peeuliar fine serration of thie fime riblets, especially those upon the coneave curve of the shell. Probably this character would be lost in worn specimens. Judging from the gradual tapering of the shell, I do not think it would attain much larger dimensions than those here given. The fine decussation of the surface is only observable in well-preserved examples. The riblets mumber sixty to sixty-six at the Jarger end and about thirty at the narrow extremity. Only one of the two specimens exhibits a slight terminal noteh, but probably the young shell would have a narrow slit. The curve of shell is different in the two examples at hand, one being straighter than the other.

## Dentalium cornu-boris, sp. n.

Testa magna, ralde currata, celeriter accrescens, alba, nitida, solidiusenla, tenuissine longitudinaliter striata, striis antice fere obsoletis, lineis inerementi oblique flexuosis senlpta, postice breciter rel vix fissa; apertura circularis, ad marginem tenuis, intus alba.
Longit. 59 mm., diam. max. 12.

Hab. Indian Ocean, 1154 fath.; var. from Station 248, W. of Travancore, 22.4-284 fath., sand.

The greater part of the surface of this interesting shell is merely finely striated, but the younger portion is somewhat distinctly lirate. It enlarges more rapidly than $D$. keras and is more finely sculptured. The variety from Station 2-18 has the striation continued to the aperture.

## Dentalium usitatum, Smith.

Dentulimn usitutum, Smith, Ann. \& Mag. Nat. Hist. 1894, vol. xir. p. 168, pl. iv. figs. $16,16 a$; Pilbbry, Man. Conch. vol. xrii. p. 2!?, pl. x. figs. 68, 69 .
Hub. Station 325, W. of Burmah, 81.3 fath.
The largest specimen is 58 mm . in lengtl, 1 mm . in diameter at the tip, and 5 anteriorly. The aper was originally desesibed as "haud fissa," but the present examples exhibit a very narrow slit, varying in length from 1 to 3 mm . The presence or absence of an apical fissure is known to be a variable character in some other species of this genus.

Dentalium insolitum, Smith.
Dentalium insolitum, Smith, Amn. \& Mar. Nat. Hist. 1894, vol. xiv. p. 168, pl. iv. figs. 17, 17 a ; Pilsbry, Jlan. Conch. rol. xvii. p. 109, pl. xxii. figs. 56, 5 万.
Hub. Station 282, off N. of Ceylon, 198-726 fath.

## Dentalium lubricatum, Sowb.

Dentalium lubricatum, Sowerly, Thes. Conch. vol. iii. p. 97, pl. cexxr. fig. 56; Reeve's Conch. Icon vol. xviii. fig. Jis; Pilsbry, Man. Couch. vol. xvii. p. 110, pl. xix. fig. 22.
Hab. Station 331, ofl Audaman Islands, 569 fath.
A single specimen about the same size as the type from Australia, but a trifle more curved, agrecing in this respect with the two other specimens receised together with the figured shell in the Cuming Collection.

## Dentalium elurneum, Lim.

Dentalium eburnenm, Limn. ; l'ilsbry, Man. Conch. vol. xvii. p. 115 , pl. xx. figs. 33, 34 .
Hab. Station 271 , off Malabar coast, $2: 2$ fath.
The single specimen, 47 mm . in length, difters only from the normal form in being a pale flesli-colour instead of white. It exhibits the raised rings and longitudinal stria so characteristic of the species.

## Dentulium subcurvalum, sp. n.

T'esta gracilis, lente accrescens, parum areuata, alba, haud nitila, longitudinaliter tenuiter lirata, liris filiformibus, antico circiter ${ }_{i} \dot{2}=$, striisque incrementi conspicuis surra et inter liras continuis sculpta.
Longrit. 63 mm ., diam. max. 6 .
Hab. Station 275, S.W. of Cape Comorin, $731-7 \pi 1$ fath.
Only a single specimen obtained. It tapers very slowly, is only slightly curved and delicately ribbed, the fine ribs being in places almost cremulate, caused by being cut through or crossed by the strong lines of growth.

## Lepidopleurus andamanicus, sp. n.

Testa parra, sordide albida, elongata, mediocriter alta, in medio fere carinata, intus albida, undique minute punctulata, epidermide guasi decidua punctata induta; ralva antica angusta, intus incrassata, margino posteriore in medio augulato ; valvie centrales angustix, apice distincto instructr, margine utrinque apicem leviter concaro ; arex laterales leviter elatie, sulco arcuato transverso utrinque sæpe senlptæ; lamine suturales parve, substriatæ; sinus mediocriter profundus; valva postica anteriore longior, in medio mucronata; ligamentum angustum, dense et microseopice spiculosum.
Longit. 13 mm ., diam. 7 , alt. 3.5 .
Hab. Off N. Sentinel Island, Andaman Islands, 210 fath. Rather like L. arctica, Sars (Moll. lieg. Aret. Norveg. pl. rii. figs. $\boldsymbol{\gamma}$ a, $\boldsymbol{\gamma}(l-\tau \mathrm{g})$, but not quite so broad, more sharply angled down the back, with a narrower sinus between the sutural lamine, more distinct apex to the central valves, s-c. The senlpture is peculiar. The surface seems to be covered with a minutely shagreened epidermis, which is easily rubbed off, leaving, lowever, the impression of the shagreening. The curved sulcus at the sides of the valves being continuous romed the shell marks off a narrow encircling zone; it is not, however, present in every specimen.

## Nucula (Acila) granulata, sp. n.

Testa ralde iuaquilateralis, orato-subtrigonalis, antice oblique subtruncata, ad extremitatem subacute angulata, postice acute rotundata, modice convexa, albida, periostraco tenui olivaceo-flaro induta, seriebus confertis arcuatis granorum postice divergentibus instructa: umbones incurrati, ad apicem læres, longe ante medium siti; lunula infra umbones excarata, dein prominens; area postica angusta, lanceolata, leris, circumscripta.
Longit. Is mm., alt. 11, diam. 7 .

Hab. Station 32 1, W. of Burmah, 448 fath.
One specimen only. Remarkable on account of the radiating series of granules or small pustules. The extreme tips of the umbones are smooth, then comes a small defined mobonal cap with aloout nine plain radiating riblets, after which commence the rows of grammes These are as broad as, or even in some cases broader than, the grooves between them. On the anterior slope they become ridges rather than rows of pustules and are at right angles to the margin of the valves. They are also very much of the same character on the lumular slope.

## Nucula Layardi, A. Adams.

Nucula Layardi, A. Adams; Hamley, Sowerby's Thes. Conch. rol. iii. p. 160, pl. cexxx. fig. I53.

Hab. Persian Gulf, 47 fath. ('Investigator'); Ceylon (Adams).

The single shell is probably adult and measures 15 mm . in length, whereas the type in the "Cuming" Collcetion is only" $10 \frac{1}{2}$, the figure abore quoted being enlarged. The Ceylon shells are evidently young, from their thimess. The present example is moderately thick, white beneath the periostracum, and beantifully white-nacreous within. The hinge-teeth are long acute, six in front and nineteen behind.

## Yoldia ricina, sp. n.

Testa $Y$. nicoharice similis. sed postice magis acuminata, striisque obliquis minus confertis insculpta; valre tenues, pellucidæ. periostraco flaro-olivaceo induta, nitida: pagina iuterna nitens, cerulco-albida: dentes postcriores circiter 266 , anteriores ad 19, paulo ralidiores; umbones lærigati, aliquanto antemediani.
Longit. $20 \cdot 5 \mathrm{~mm}$., alt. $11 \cdot 5$, diam. 7 .
Hab. Persian Gulf, 35 and 47 fath.
This species is very like Y. nicobarica, Brng., but is more sharply pointed at the posterior extremity, which is not so high up as in that species. The obligue strixe are much fewer and further apart, and terminate in an oblique line nearer the middle of the values. Two specimens only were obtained.

## Malletia Lrevis, sp. n.

Testa oblonga, antice rotundata, postice subquadrata, multum convexa, periostraco ritente flavescenti induta, apices versus pallidior, incrementi lincis tenuibus sculpta, striis postice magis conspicuis,
confertioribus; lmula angusta, concava, carinis circumscripta; area postica mulla; dentes erecti, acuti, anteriores circiter 14 , posteriores ad 21 .
Longit. 14 mm., alt. 10 , diam. 7 .
Mab. Station ${ }^{31} 18$, of $\mathrm{W}^{\circ}$. of Ceylon, 1085 fath.
Diflers from M. conspicua, Smith, in form and senlpture, being more romeded in front, shorter, and squarer posteriorly. A single specimen.

## Solenomya putayonica, Smith.

Silenomya patagonica, Emith, Ann. \& Mag. Nat. Ilist. 189, vol. xvi. p. 11 .

Mul. Station 260, WT. of Cape Comorin, 487 fath., grey mud and Globigerine ooze; Station 3:27, W. of Burmal, 419 fath.

A single specimen from the latter station is remarkable for its great size. The shell, exclusive of the cxtension of the periostracum, is 100 mm . in length and 33 in height, being much larger than any of the other known species.

Arca (Acar) domingensis, Lamarck.
Hub. Station 291, Gulf of Oman, 48-19 fath.
A very widely distributed species, occurring in various localities in the Atlantic, Indian, and Pacific Occans.

Arca (Barbutia) pteroessa, Smith.
Arca (Barbatia) pteroessa, Smith, Ann. \& Mag. Nat. Hist. 1904, vol. xir. p. 12.
Hab. Station 316, S. of Ceylon, 1500 fath.
Arca (Barbatia) incerta, Smith.
Arca (Barbatia) incerta, Smith, Ann. © Mag. Nat. Mist. 1899, vol. iv. 1. 2.5l ; Illust. 'Zool. 'Investigator,' Mollusca, pl. xiii. figs. 3, 3 a.

Hab. Station 333, Gulf of Manar, 401 fath.
These specimens are larger than the type, measuring 29 mm . in length, 15 in height, and $11 \cdot 5$ in diameter.

Arca (Barbatia) innocens, sp. n.
Testa parra, oblonga, ralde inæquilateralis, mediocriter convexa, ntrinque obliqua, alba, radiatim tenuiter confertim costulata, costis subnodulosis, posterioribus quam anticis magis distantibus, periostraco temui, inter costas plus minus hirsuto, induta; latus anterius oblique curratum, supra acute angulatum, posticum
primo recte obliquum, ad extremitatem acute rotuudatum ; maran ventris rectinsculns; valve haud crassie, intus cieruleo-albide, radiatim subsulcate, ad marginem denticulatic; area dorsalis lanccolata, periostraco fusco induta; umbones longe antemediani, circiter in $\frac{1}{5}$ longitudinis collocati; dentes cardinis parvi, circa $30-32$.
Longit. 18 mm. , alt. $11 \cdot 5$, diam. 7 .
Hub. Station 258, W. of Travancore, 102 fath., sand.
This species may be separated from A. incerta, Smith, both by its form and sculpture. That species is narrow anteriorly and widens behind, whereas the present form is almost equally broad at both ends. The surface of the valves is less distinetly granulated and the ribs upon the posterior slope are fewer, broader, and further apart than in incerte. 'I'he hinge-tecth are different in the two species, those at the hinder end of incertu* heing peculiarly oblique, whereas in this species they are more,upright and coarser.

## Limopsisindica, Smith.

Limopsis indica, Smith, Anu. \& Mag. Nat. IIist. 1894, rol. xir. p. 171, pl. v. fig. 7 ; 1895, vol. xvi. p. 15 ; 1904, vol. xiv. p. 12.
Hab. Station 249 S.W. of Cape Comorin, 1022 fath., green mud and Globigerine ooze ; Station 269, W. of Cape Comorin, 46 t fath., green mud and sand; Station?, 1055 fath.

Some of the specimens from the above localities are considerably larger than the type, being 30 mm . in length, 27 high , and 14 in diameter.

## Modiola philippinarum, Hanley.

Morliota phitippinarum, Hanley, Proc. Zoul. Soc. 1SIt, p. 15; Cat. Recent Shells, p. 203, pl. xix. fig. 26; Lieere, Con. Icon, vol. x. fig. 1.
Hab. Persian Giulf, 27 fath.
The single specimen is rather narrowed po-teriorly, but agrecs in every other respect with the typieal form.

Mudiola (Amygdahum) IVatsoni, Smith.
Moutiola Hiutsoni, Smith, Am. \& Mar. Niat. Mist. 180.5, vol. xri. p. 14; 1904, vol. גiv. p. 11.
Hu6. Station 265 , oft N. of Ceylon, $2.25-594$ fath.; Station 267, ofl W. of Cerlon, 45-j59 lath. ; Station 3 J 10 , Lull of Oman, 2(j) fatll.

## Modiolu (Amyydulum) arborescens (Chemnitz).

Modiola arborrscens, Chemnitz: Reeve, Coneh. Ieon. rol. x. fio, 30; C'le-sin, C'onch.--C'nl., Mytilidee, p. 100, pl. xxix. fig. I0.
Hub. Station 316, Persian Gulf, 47 fath. ('Investigator') ; Tasmania and ofl' Syducy (Bruzier).

## C'renella persica, sp. in.

Testa parra, irregulariter orata, globosa, tenuis, sordide pellucidoalbida, liris tenuissimis radiantibus aliisque concentricis paulo remotis eancellata; umboues leres, incurvati, albi, contigui, terminales ; pagina interna nitida, structuram cancellatam externam exhibens, ad marginem undique denticulata; dens cardinis unicus, plus minus bilidus in ntraque ralra; ligamentum gracile, intra marginem situm.
l.ongit. 6 mm ., alt. $4 \cdot \overline{5}$, diam. 4 .

## Hab. Persian Gulf, 47 fath.

The viry delicate radiating costelle have a tendency to bifureate at the outer margin.

## Anussium caducum, Smith.

Amussium caducum, Smith, Amn. \& Mag. Nat. Hist. lo9t, vol, xir. p. 173 : 189.5 , vol. xvi. p. 18 ; 1904 , vol. xiv. p. 13.

Hab. Station 269, W. of Cape Comorin, 464 fath., green mud and sand; Stations 289, 297, Gulf of Oman, 667-811 fatl.; Station 322, Andaman Islands, 378 fath. ; Station 327 , W. of Burmah, 419 fath.

## Amussium Alcochi, Smith.

Amussiunn Alcock, Smith, Ann. \& Mag. Nat. Hist. 1894, rol. xiv. p. 1i.2, pl. r. figs. 15, 16 .

Hab. Station 275, S.W. of Cape Comorin, 731-7\%1 fath.

## Amussium investigatoris, sp. n.

Testa subcircularis, compressa, fragilis: valra destra albidopellucida, radiis opaco-albis circiter 10 picta, coucentrice regulariter et tenuiter striata, intus costis ad 10 albis mediocriter erassis haud ad marginem attingentibus instructa; ralva sinistra convesior, flacescens, radiis decem aurantiacis ornata, radiatim temiter costulata et concentrice delicate lamellata, lamellis supra costulas squarculatis, intus flavescens, costis albidis 10 tenuioribns munita; auriculæ parree, subaquales; umboues acuti, lateribus ad angulum circa 113 consergentibus.
Longit. 26 mm ., alt. $26 \cdot 5$, diam. $5 \cdot 5$.

Hab. Station 218, W. of Travancore, 22 1-28 1 fath., sand.
The sculpture of the twio valves in this beantiful species is altogether different, that of the right valve, which is a little flatter than the left, consisting of very delicate and close-set regular lamella or strie, whilst the left valve has mmerous fine radiating riblets, which are minutely squamose through being erossed by the very fine concentric lamella. The internal riblets, ten in number in cach valve, do not reach to the margin, and those of the left valve are a little finer than those of the right. The colonr of the valses is also different. The deeper valve is more or less orange-tinted within and without, whereas the right valve is almost white, with only a trace of colour on cach side towards the dorsal slopes.

## Amussium manaricum, sp . n .

Testa fracilis, pellucido-albida, opaco-albo radiata, inarquiralris, leviter obliqua, et paulum inecquilateralis, valsa sinistra convexiuscula, concentrice tenuiter lamellata, lirisque radiantibus tenuibus plus minus cancellata, valra destra concentrice lamellata, versus marginem concava; umbones acuti, ad angulum circa $115^{\circ}$ convergentes; liræ internse circiter 35 , haud ad marginem continuæ. illis in valva sinistra tenuioribus; auriculæ inæquales, anticis paullum majoribus.
Longit. $24^{+5} \mathrm{~mm}$., alt. 26, diam. $4^{4} 5$.
Hab. Station 333, Gulf of Manar, 401 fath. ; Station 32:2, Andaman Islands, 378 fath.

The valves are fairly strong up to the ends of the radiating lire, but beyond that point ther become very fragile and easily break away. The coneentric fine lamellæ are very similar in both valves, but the left valve, which is gently convex from the umbo to the opposite margin, also exhibits fine radiating liræ. These, however, gradually disappear about the middle of the valre, so that only the upper half of the surface is eancellated. Thic auricles, of which the anterior are a triffe larger than the posterior, exhibit fine lines of growth and a few radiating threads also, excepting the hinder auricte of the right valve, which hardly shows any trace of this radiating sculpture. The front auricle of the same valse is bounded below by a narrow groove at the byssal sinus.

Loripes victorialis (Melvill).
Ciyptodon victorialis, Melvill, Aun. \&- Mag. Nit. Hist. 189!), rol. is. 1. 98 , pl. ii. fig. 8.

Hab. Station 346, Persian (iulf, 47 fath.
The presence of hinge-teeth, as alescribed by Mr. Melvill,
at onee removes this species from Cryptodon, which is edentulons. 1 am inclined to refer it to the genus Laripes, with which it is practically identical in dentition, but the ligament is not quite so deeply placed within the dorsal margin.

Lucina dentifera, Jomas.
Lucina dentifera, Jonas ; Smith, Amu. \& Mar. Nat. Hist. 1904, vol, xiv. p. 10.

IIab. Station 346, Persian Gulf, 47 fath.

## Lucina bengalensis, Sinitlı.

Lucina benyalensis, Smith, Amn. \& Mag. Nat. Hist. 1891, vol. xiv. p. 171 , pl. v. figs. 1,$2 ; 1904$, rol. xiv. p. 10.

Hab. Station 261, W. of Cape Comorin, 396-4.45 fath, green mud and sand ; Station 3:3, N. of Andaman Islands, 463 fath.

## Cryptodon investigatoris, Smith.

Cryptudon incestigatoris, Smith, Amm. \& Mag. Nat. Hist. 1895, vol. xri. p. 13, pl. ii. figs. $6,6 a ; 189$ i, vol. xviii. p. 3 3it ; 1904, vol. xiv. p. 10.

Hab. Station 336, W. of Ceylon, 603 fath.

## Cryptodon omanensis, sp. n.

Testa quadrato-rotundata, compressa, inæquilaterulis, alba, lineis incrementi tenuibus ormata, striisque radiantibus tenuissimis umbones versus sculpta; lunnla parva, excavata, circumseripta; unbones antemediani, acuti, approximati, ad apicem leres ; linea eardinis leviter incrassata, leeris, edentula; ligamentum in sulco angusto profundo intra marginem situm; valve subtenuos, intus radiatim tenuiter striate, cicatrice angusta, haud profunda, ab umbone marginem ventralem versus extendente seulpte; cicatrix antica angusta, longit. 10 mm ., intra lineam pallii sita, postica brevior, latior.
Longit. 26 mm ., alt. 24, diam. 10.
Hab. Station 34l, Gulf of Oman, 230 fath.
A flat compressed species like (. barbatus (Reeve), but thinner, lighter, and different in form. The coneentric sculpture is rery fine and at each side is slightly lamellated. 'The anterior and posterior ends are both somewhat roundly angulated and the ventral margin shaply arcuate.

Cardita elegantula, var. conferta, Smith.
Cardita eleymentula, Deshayes; Smith, Ann. \& Mag. Nat. 11ist. 1901, vol. xir. p. 9.
Hab. Station 328, S. of Lower Burmah 61 fath.
The two specimens from the above lonality and those already recorded in the 'Anuals' are not quite identical with Deshayes's type. They have a few more ribs, the sulci between them are not quite so deep, and the nodules on the coste are closer together. Howerer, I am of opinion that a more extended series of specimens would show that these differences were not of specific value.

## Crussatellistes omanensis, sp. n.

Testa C. abrupter, Sowb.*, similis, sed major, magis compressa, costis concentricis postice haud interruptis; ralvie mediocriter crassx, iutus et extra albidæ.
Longit. 3.5 mm ., alt. 23 , diam. 17 .
Hab. Station 311, Gulf of Oman, 230 fath.
Beyond its superior size, rather compressed form, and continuous costre there is little to distinguish this form from its South-African congener. The outline is rery similar, the radiating microscopic striation is the same, the strength of the costre, the eharacter of the lnnule, the escutcheon, the hinge, the sears, and the crenulation of the edge of the salves are all very much alike in both forms.

## Abra maxima (Sowerby).

Abra maxima, Sowerby ; Smith, Ann. © Mag. Nat. IIist. 189t, vel. xir. pl. x. figs. $\overline{\text { b }}, 6 ; 1 \leq 95$, vol. xti. p. $10 ; 1904$, vol. xiv. p. 11.
Hab. Station 263, off N.E. coast of Ceylon, 665-ifl fath., sand and soft green mud; Station 265, off N. of Ceylon, 225-591 fath., mud ; Station 299, Gulf of Oman, $1: 299$ fath. ; Station 301, off Mckran coast, 1000 fath.; Station 3:?1, off S. of Ceylon, 660 fath. ; Station 327, W. of Burmah, 419 fath.

## Abra affinis, Smith.

Abra affinis, Smith, Am. © Mag. Nat. Hist. 189), vol, iv. p. D.50: 190t, vol. xir. p. 11; Illust. Zool. 'Investigntor', Noll. pl. xiii. figs. $\because, \geq a$.
Hab. Station 205, ofl N. of Ceylon, $2 \cdot 2 J-591$ fath., muct.
A single specimen, with the preeding species.

* Marine Invert. S. Lfriea, rol. iv. Molluca, p. 10, pl. vi. fig. 1s, as Cirassatella.

## Tellina travancorica, Smith.

Tellina traxancorica, Smith, Ann. \& Mag. Nat. IList. ]899, yol. iv. p. थ! 19 ; 1!Ot, vol. xiv. p. 11; Illust. Zool. 'Investigator;' Mull. pl. xiii. firs. 1,1 a.
Hab. Stations 259, 337, W. of Malabar coast, 271-360 fath., green sand and mud.

These specimens, which appear to be adult, are somewhat smatler than those originally deseribed, and the concentric sculpture is a little finer and closer together.

Tellina (Arcopagia) Isseli, H. Adams.
Tellimu (Arcopuyia) Isseli, H. Adams, Proc. Zool. Soc. 1870, p. 790 , pl. alviii. fig. 10.
Hab. Station 291, Gulf of Oman, 48-19 fath.
A single specimen without colour-rays an in the type from the Gulf of Suez, but like it in being marked with a red rust-like stain at the posterior end.

## Tellina (Arcopayia) altissima, sp.n.

Testa parva, triangulatim rotundata, fere æquilateralis, valde conresa, dilute fusco-albida; latus anticum acute rotundatum, posticum magis acuminatum, subrostratum ; margo dorsi utrinque valde declivis, anterior arcuatus, posterior rectiusculus; rentris margo multum curvatus; valre haud crassæ, leviter nitentes, lineis incrementi tenuibus sculptæ, striisque radiantibus teunissimis subobsoletis ornatæ, intus distinctius radiatim striatæ, et plus minus albo-fusco tincte.
Longit. 16 mm ., alt. 14, diam. 10.
Hub. Off Port Blair, Aulaman Islauds, 100 fath.
Somewhat rese:nbling T. robusta, IIanley, but less solid and not quite of the same form. It is remarkably high in proportion to the length. The lateral tecth are long, slender, and remote.

## Macoma blairensis, sp. n.

Testa oblonga, valdo inæquilateralis, compressa, antice rotundata, postice oblique truncati, sordide albida, concentrice tenuissime striata, striis postice tenuiter lamellosis; margo dorsi anticus arcuatim descendens, posterior magis obliquus, rectus, brevior, rentralis late curratus; ralve mediocriter tenues, subuitentes, et radiatim microscopice striate; plica postica, ab umbone ralre dextre radians, vix conspicua; cicatrix antica elongato-piriformis, postica rotundata ; siuns pallii latus, profundus.
Longit. 44 mm., alt. 31, diam. 11.

Hab. Off Port Blair, Andaman I, lands, 100 fath.
Something like M. gubernaculum (Hanley) in shape, but with a broader truncate end. The very fine lamellate sculpture behind the feeble posterior radiating plication is peculiar, the rest of the surface being smoother.

## P'sammobia micans (Hanley).

Tellina micans, Hauley, Sowerby's Thesaur. Conch. vol i. p. 504, pl. lix. fig. 106; liöner, Conch.-C'ab., Tellina, p. 1:20, pl. xxxiii. figs. 5 - -7 .
Hab. Persian Gulf, 31 feth. ('Investigator') ; Philippine Islands (Hanley).

On account of the absence of lateral teeth and the oblique sculpture I am inclined to believe that this species should be referred to Psammobia. Römer considers Tellina depauperata, Martens, the same as the present species.

## Cardilia semisulcata (Lamarck).

Cardilin semisulcuta, Lamk. ; Sowerby, in Reeve's C'onch. Icon. vol. rix. fig. 1 ; H. \& A. Adaus, Gen. Rec. Moll. vol. iii. pl. cxii. figs. $6,6 \pi$; De:hayes, Traité élément. Conch. vol. i. pt. 2, p. 2.54, pl. viii. bis, figs. 16-18.
Hab. Off' Port Blair, Andaman Islands, 100 fath
Only a single valve of this rare but widely distributed species was obtained. It has been recorded from South Australia (Lamarck), Straits of Malacea (Deshayes), China (Souerby), Japan (Lischke), and specimens in the Cuming Collection are said to be from the l'hilippine Islands.

## Mactrinula tryphera, Melvill.

Mactrinula tryphera, Melvill, Anu. \&E Mag. Nat. Hist. 1899, rul. iv. p. 97, pl. ii. fig. $\overline{7}$.

Hab. Station 3tõ, Persiau Gulf, 35 fath. ('Insestigator' and Melvill).

An odd valve or two, the largest being 28.5 mm . in length, or 6 more than the type.

Meretrix (Caryatis) mudicissima (Smith).
Cytherea (Caryatis) pudicisima, Smith, Anu. \& May. Nat. 1list. 1094, vul. xiv. p. 169 , pl. r. figs. 3, 4.
Hab. Station 34, Gulf of Oman, 230 fath. ; Station 241 , off $\mathbb{W}$. coast of Ludia, 119-1:24 fath.

The type originally deseribed was evidently only a young specimen, for the examples from the above locality (3+1) are
considerably larger and more solid shells, but agree in other respects. 'The largest is 23 mm . long, 20 in height, and 15 in dianeter. The specimens from Station 214 are smaller and shorter than those from Station 341 : length 16.5 mm ., licight 16 , diameter $1 \times 25$.

## Vesicomya cretacea, sp. n.

Testa oralis, valde inæquilateralis, mediocriter conrexa, antice late rotındata, postice magis acuta, alba, cretacea, periostraco tenuissimo sordide flarescente hic illic induta, striis incrementi subrugose sculpta; lunula elongata, cordiformis, linea impressa circumseripta; area ligamenti elongata, profunda, utrinque carinata; valve mediocriter crasse, iutns albæ; cicatrix antica elongata, lervis, postica latior; linea pallii lata, leris, haud sinuata; dentes cardinis duo in utraque ralva, illis valve sinistre conjunctis, divergentibus.
Longit. 57 mm ., alt. 40 , diam. 25.
Hab. Station 327, W. of Burmah, 419 fatlı. ; Station 318, off W. of Ceylon, 1085 fath.

Beneath the ligament there is in each valve a rather deep groose, which starts a little behind the umbo and extends backwards about 8 mm ., becoming gradually broader. It does not, however, appear to be for the reception of a resilium, the ligament being distinctly external.

More inæquilateral than $V$. lepta, Dall, from California, with the posterior dorsal margin more curved, the anterior more descending, and the hinge rather stronger.

The specimens from Station 318, the largest of which is only 44 mm . in length, and perhaps not adnlt, are thinner than the unique type, with a less strong hinge and only a faint indication of the groove in the nymphre described above.

## Vesicomya brecis, sp. n.

Testa breris, subquadrata, multum convexa, ralde inæequilateralis, utrinque late rotundata, postice supra subangulata, striis incrementi aspere sculpta, rufescenti-albida; valre haud crasse, infra marginem dorsi posticuin sulco lato, haud profundo et parum conspicuo instructæ, intus albæ, radiatim obscure striatæ; lunula cordiformis, linea impressa circumdata; area dorsalis posterior profunda, lata, utrinque carinata: dentes duo in utraque ralra, illis valvæ sinistræ conjunctis, antico valvæ dextræ erecto, postico irregulari.
Longit. 36 mm ., alt. 30, diam. 22.
Hab. Station 259, W. of Malabar coast, 295-360 fath., green mud and sand.

Ann. \& Mag. N. Hist. Ser. 7. Vol. xviii.

The muscular scars and pallial line are the same as in $V$. cretacea. There is a slight indication of the sulcus beneath the ligament mentioned as occurring in that species, and in the left valve there is an elevated ridge below it which might almost be regarded as a tooth. The dorsal escutcheon is both broader and deeper than in V. cretacea.
$V$.indica, Smith, has the anterior end more produced and more narrowed, the posterior end more sharply curved and not so distinctly angulated at its junction with the dorsal outline. The escutcheon in the present species, which may be only a variety of indica, is broader and deeper.

## Cardium exasperatum, Sowerby.

Cardium exasperatum, Sowerby ; Reere, Coneh. Icon. vol. ii. fig. 107; Römer, Conch.-Cab. p. 27, pl. ix. figs. 2, 3.
Hab. Off Port Blair, Andaman Islands, 100 fath. ('Investigator') ; Swan River (Sowerby); Hong Kong (Garrett).

## Cardium fornicatum, Sowerby.

Cardium fornicatum, Sowerby ; Reeve, Conch. Icon. vol. ii. pl. xx. fig. 110.
Hab. Andaman Islands, 60 fath.
Also known from the Red Sca.
Corbula crassa, IIinds.
Corbula crassa, Hinds ; Reeve, Conch. Icon. vil. ii. figs. $8 a-c$; Smith, Lamellibranchiata 'Challenger' Exped. p. 30.
Hab. Off Port Blair, Andaman Islands, 100 fath.
Also known from Torres Straits, Port Essington, Straits of Macassar, and the Philippine Islands.

Corbula persica, sp. n.
Testa parra, valdo inæquivalris, paulum inæquilateralis, subtriangularis, postice truncata, alba, al apices flarescens; valva dextra transsersim fortiter et confertim costulata, sinistra concentrice tenuiter striata, epidermide fibrosa propo marginem induta, lirisque pancis radiantibus instructa; umbones herigati, flarescens.
Longit. 7 mm ., alt. 6, diam. 4.5 .
Hab. Station 346, Persian Gulf, 47 fath.
This species in size, form, and sculpture is rather like C. Philipuii, Smith *, a West Indian species. The young

- Lamellibrauchiata 'Challenger' Exped. p. 83, pl. rii. figs. 4-4b.
shell, however, is different in size and shape and the right valve is less distinetly kected posteriorly. C' bifrons, A. Adams, is another allied form. The white ribs, which contrast strongly with the yellow nuclear shell, are about seventeen to twenty in number. The right valve exhibits a faint rounded angle from the umbo to the lower corner of the posterior end, but less pronounced than that in C. Philippii.

## Corbula andamanica, sp. 1 .

Testa C. persicie similis, sed postice minus distincte truncata, valva dextra ad umbonem magis producta, costis tenuioribus, magis numerosis instructa.
Longit. 6.5 mm ., alt. 6, diam. 4.
Hab. Off Port Blair, Andaman Islands, 100 fath.
Very like C. persica, yet differing in the points indicated. The ribs, which are dirty yellowish, are about twenty-five in number. C. albuginosa, Minds, is closely allied, but longer, and with the right valve more finely sculptured.

## Solecurtus (Azor) coarctatus (Gmelin).

Solecurtus ( 1 zor ) coarctutus (Gmelin); Smith, Lamellibranchiata 'Challenger' Exped. p. 79.
Hab. Station 295, Gulf of Oman, 3i-40 fath.
Also known from the Nicobar and Philippine Islands. The synonymy and some remarks upon this species are given at the above reference.

## Lyonsiella papyracea, Smith.

Lyonsiella papylracea, Smith, 'Challenger' Lamellibranchiata, p. 73, pl. xxv. tigs. 2-2 b; Pelseneer, Anat. 'Challenger' Deep-sea Moll. p. 18 , pl. ii. fig. 8.

Hab. Station 276 , W. of Ceylon, 1006 fath. ('Investigator') ; about 1100 miles south-west of Australia, in 1950 fath. ('Challenger').

The single specimen differs from the type in having more numerous radiating threads, about fifty-six altogether. It is rather larger and less fragile, and has a somerthat thicker and coarser periostracum. The form is rery similar, although not absolutely identical; but that is a character which is liable to considerable variability.

## Cuspidaria approximata, Smith.

Cuspidaria approximata, Smith, Ann. \& Mag. Nat. Hist. 1896, vol. xviii. p. 373; 1llust. Zool. 'Investigator,' Moll. pl. viii. figs. 2 2 $a$.
Hab. Station 322, Andaman Islands, 378 fath.
A single specimen 2 mm . longer than the type. Specimens from the Gulf of Oman have been presented to the British Museum by Mr. J. C. Mclrill.

## XXXVII- Notes on the Gemus Otomys: By R. C. Wroughton.

The material available to me for examination in the collection of the Natural History Museum amounts to about 150 specimens (skins and skulls) from some 30 localities. Though Africa north of the Equator is very poorly represented, yet, at first sight, the total material secms sufficient for a fairly exhaustive classification; but, on careful comparison, I am convinced that this is not so, and that the area south of the Zambesi, which is especially well represented by series from many different localities, is just that in which the results I have obtained are the furthest from finality.

All but two species of the genus have the anterior molar in the lower jaw composed of four lamince or their equiralents. Setting aside for the moment these two aberrant forms as Section III., the genus may be easily further divided into two scetions, according as the lower incisors are smooth (or but faintly groored), or are markedly groored ; and cach of these Sections falls again naturally into two groups. In Section I., comprising the forms with smooth lower incisors, those in which the posterior molar in the upper jaw is composed of four lamine (or their cquivalcnts) and large bulle form the Brantsi group, and those in which $\mathrm{m}^{3}$ is composed of five lamina and the bulla are quite small form the unisulcatus group. In Scetion II., comprising the forms with grooved lower incisors, those with a single groore as in irroratus, Brants, are readily separated from those with a domble groove as in Jacksoni, Thos.

The geographical distribution faily closely agrees with these main divisions of the genus. Thus Section 1. is found in a strip of comtry roming across $S$. Africa between $\ddot{L S}^{\circ}$ and $32^{\circ} \mathrm{S}$. lat. Of Section II. the Jucksom group is found
